

Requirement Gathering Functional Requirements.

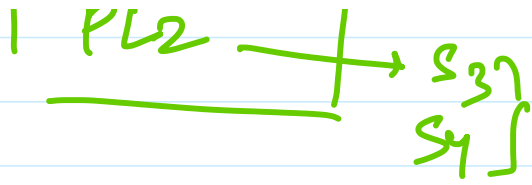

1. User can play, pause songs
2. User can create playlist, add songs to PL,
Play entire playlist (sequential manner, Random manner, custom etc).
3. App should support multiple output devices (Bluetooth, speaker, wired speaker, headphones etc).

Non Functional Requirements

1. Entire Design should be easily scalable
2. New feature (new output device, new way to play songs from PL etc) can be easily added.

Happy flow,

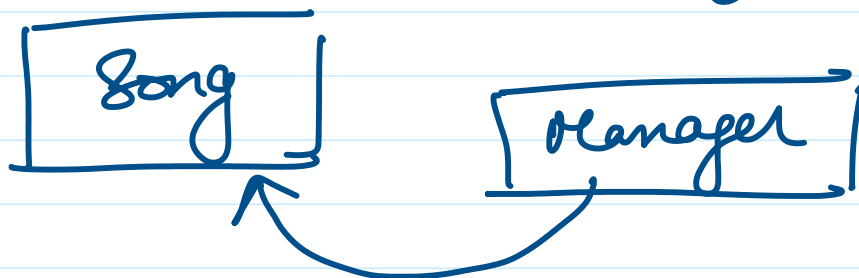

We will use :-

1. Strategy Pattern
2. Singleton
3. Adaptor
4. Factory
5. facade .

We know we have 'song' object

There should also be Manager which will do CRUD operation on this .

If 'playlist' is a object then it will access songs from Manager only.

More than 'song' object's manager we require manager for playlist.
